Modems and routers are devices that allow computers and other devices on a network to access the internet as well as to communicate with each other. They can work wirelessly, rely on cables, or exploit a combination of the two depending on the specific devices involved and the preferences of individual users. But, while both devices serve similar n. Like cell phones and radios, WiFi uses radio waves to connect devices to a network. A wireless adapter first converts data into radio waves and transmits it using antennae. Then another device receives the information via its antennae and decodes it using its adapter. The process is bi-directional, so information can be sent both ways, just as with. Despite all the improvements in WiFi over the past decade, there are still a few circumstances when you may want to use an ethernet cable to connect to the internet. An ethernet connection offers the fastest speeds and the lowest latency. For the most important professional tasks where consistent real-time connectivity with minimal interruptions is.
